

Zariya Web App Functional Description

1. Product overview

Zariya is a web app that helps Indian couples plan destination weddings in a calmer, more organized way.

The app replaces scattered planning across WhatsApp messages, Excel sheets, notes, screenshots, vendor calls, reminders, and separate payment records with one central wedding planning workspace.

Zariya is designed for Indian destination weddings, where there are usually multiple celebrations such as Haldi, Mehendi, Sangeet, Wedding, and Reception, along with guests, vendors, budgets, payments, timelines, checklists, and event schedules.

The purpose of Zariya is not to be a vendor marketplace or inspiration platform. It is not mainly for browsing ideas or booking vendors. Its purpose is to help the couple stay in control of the wedding planning process.

The app should help the user clearly understand:

- What needs to be done
- When it needs to be done
- Which event it belongs to
- Which vendor is involved
- What has been paid
- What is still pending
- What is over budget
- What needs attention next

The most important principle of the app is:

The user should enter information once, and Zariya should automatically use it everywhere else it is needed.

For example, if a guest is added in the Guests page, their RSVP status and invited events should automatically affect the dashboard, guest totals, and event guest counts. If a vendor payment is entered in the Vendors page or Payments page, it should automatically affect the Budget page, Payments page, Dashboard, and vendor status.

The user should never need to enter the same detail twice.

2. MVP scope

For the MVP, Zariya should focus only on core planning functionality.

The MVP should include:

- Dashboard
- Timeline
- Budget
- Payments
- Events
- Guests
- Vendors
- Settings / basic wedding setup

The MVP should not support media or document storage. This means there should be no user-uploaded contracts, receipts, PDFs, images, or event photos. If the design shows event images, they should be system-provided default visuals based on event type, not user-uploaded images.

Vendor details, contract status, payment status, notes, and payment information should be entered manually through form fields.

The MVP should also avoid advanced collaboration features. The app should work as a personal planning workspace for the couple rather than a shared family collaboration system.

Travel and stay details for individual guests are also outside the MVP scope. Guest records should focus on names, contact information, RSVP status, side/segment, invited events, and notes.

3. Overall app structure

The app has a left sidebar, a wedding header, and a main content area.

Left sidebar

The sidebar provides access to the main sections of the app:

- Dashboard
- Timeline
- Budget
- Payments
- Events

- Guests
- Vendors
- Settings

The active page is highlighted with a soft cream or gold background. The sidebar should feel elegant, calm, and consistent with the premium Indian wedding theme.

If pages such as Documents or Travel & Stay appear in the visual design, they can be hidden or disabled for the MVP unless they are later added as full features.

Wedding header

Most pages should show the same wedding header at the top.

The header includes:

- Wedding name
- Wedding location
- Wedding date range
- Search bar
- Notification icon
- User profile menu

Example:

Aisha & Rohan's Wedding
Udaipur, Rajasthan
14–16 November 2025

This wedding information is entered during onboarding or setup and then appears automatically across the app.

Global search

The search bar should allow the user to search across core planning information.

Search should include:

- Guests
- Vendors
- Events
- Tasks
- Payments
- Budget categories
- Notes

For example, if the user searches “Mehendi,” results may include the Mehendi event, Mehendi checklist items, vendors linked to Mehendi, and guests invited to Mehendi.

Notifications

The notification icon should show important planning alerts.

Examples:

Payment due soon
Task overdue
Vendor payment pending
Budget category over budget
RSVPs still pending
Event checklist incomplete

Clicking a notification should take the user to the related page or item.

4. First-time dashboard guidance

Because Zariya is a complex planning app, a first-time user should not land on the dashboard with no guidance.

When a new user opens the dashboard for the first time, the app should show a quick guided setup tour. This should work like the small floating walkthroughs seen on many websites, where short tooltips point to important areas of the interface.

The goal is not to explain everything in detail. The tour should quickly show the user what to do first.

The first-time dashboard guide should include simple steps like:

1. **Start with your wedding details**
A tooltip points to the wedding header or setup area and explains that the wedding name, location, and date range power the rest of the workspace.
2. **Select your wedding events**
A tooltip points to the Events section and explains that selected events such as Haldi, Mehendi, Sangeet, Wedding, and Reception will create event cards automatically.
3. **Add your guests once**
A tooltip points to the Guests page and explains that guest totals, RSVP numbers, and event guest counts are calculated automatically from the guest list.

4. **Add your vendors once**

A tooltip points to the Vendors page and explains that vendor details, payment status, and budget impact are reused across the app.

5. **Set your budget**

A tooltip points to the Budget page and explains that budget health is calculated from category estimates and actual vendor/payment entries.

6. **Track what needs attention**

A tooltip points to the Dashboard attention section and explains that upcoming tasks, pending payments, and alerts will appear there.

The tour should have:

Next button

Back button

Skip button

Finish button

After the user finishes or skips the tour, it should not appear again unless they restart it from Settings or Help.

5. Onboarding and setup flow

Before the user reaches the full workspace, Zariya should collect the basic information needed to create the wedding plan.

Step 1: Wedding details

The user enters:

Couple names

Wedding name

Wedding location

Wedding start date

Wedding end date

Overall wedding budget, optional at first

This information appears in the header and dashboard.

Step 2: Select wedding events

The user selects which events are part of their wedding.

Common options:

Haldi
Mehendi
Sangeet
Wedding
Reception
Engagement
Cocktail
Welcome dinner
After party
Custom event

Only selected events should appear in the Events page.

If the user selects Haldi, Mehendi, Sangeet, Wedding, and Reception, those five event cards should be created automatically.

If the user does not select Mehendi, no Mehendi card should appear.

Step 3: Choose planning phase

The app asks how far away the wedding is.

Options can include:

12 months before
10 months before
8 months before
6 months before
4 months before
2 months before
1 month before
Wedding week

This determines which default planning checklist phase is most relevant.

Step 4: Budget setup

The user can choose how they want to track budget.

The simplest MVP method should be category-based budgeting.

Default categories can include:

Venue
Catering
Decor

Photography
Entertainment
Hospitality
Transport
Outfits
Invitations
Gifts
Miscellaneous

The user should be able to edit category budgets later.

Event-based budgeting should only be used if the user chooses to assign separate budgets to events. Otherwise, event pages should not require separate budgets.

6. Dashboard page

The Dashboard is the main overview page. It should answer:

“What is happening with my wedding, and what needs my attention next?”

The dashboard should show the most important information from across the app in one place.

Dashboard sections

The Dashboard includes:

Wedding countdown
Planning progress
Guest summary
Attention-needed tasks
Event itinerary
Budget summary
Vendor and payment summary

Wedding countdown

The countdown shows how many days are left until the wedding starts.

This is calculated automatically from the wedding start date.

Example:

108 days to go

Planning progress

Planning progress shows how much of the planning checklist has been completed.

Example:

68%

On track

This is calculated from completed timeline tasks.

Guest summary

The guest summary shows RSVP progress.

Example:

176 / 250 accepted

This comes automatically from the Guests page.

The user should not manually enter this number on the Dashboard.

What needs your attention next

This section shows the most important upcoming or overdue items.

Examples:

Confirm decor vendor

Finalize rooming list, if this feature is later enabled

Payment due to Royal Events

Invitation follow-up

Final menu tasting

For the MVP, this section should mainly pull from:

Timeline tasks

Payment due dates

Vendor statuses

Budget alerts

Guest RSVP status

Each item should show:

Task title

Category

Due date
Priority

Clicking an item should open the relevant page or detail view.

Event itinerary

This shows the main wedding events in date and time order.

Example:

Haldi — 14 Nov 2025 — 10:00 AM–12:00 PM
Mehendi — 14 Nov 2025 — 04:00 PM–07:00 PM
Sangeet — 14 Nov 2025 — 08:00 PM–11:00 PM
Wedding — 15 Nov 2025 — 04:00 PM–07:00 PM
Reception — 16 Nov 2025 — 08:00 PM–11:00 PM

This information comes from the Events page.

Budget summary

The dashboard shows a simple budget overview:

Total budget
Amount spent
Remaining amount
Budget status

These numbers come from the Budget and Payments pages.

Vendor and payment summary

This section shows:

Upcoming payments
Vendors needing attention
Confirmed versus pending vendors

The data comes from Vendors and Payments.

7. Timeline page

The Timeline page is for wedding planning tasks. It is not the wedding-day schedule.

It answers:

“What should I do, and when should I do it?”

Timeline layout

The page includes:

- Task summary cards
- Planning phase sidebar
- Task list
- Filters
- Phase progress
- Upcoming task panel

Planning phases

The timeline should be divided into fixed planning phases:

- 12 months before
- 10 months before
- 8 months before
- 6 months before
- 4 months before
- 2 months before
- 1 month before
- Wedding week

Each phase has a pre-decided checklist that applies to most Indian destination weddings.

The user can mark tasks as done, change status, change due date, and edit task text.

Default timeline checklist

12 months before

- Set wedding date range
- Decide destination city
- Create rough guest count
- Set overall budget
- Create initial event list
- Shortlist venues
- Shortlist planner, if needed
- Create vendor category list

Discuss key priorities
Set up Zariya workspace

10 months before

Compare venue options
Confirm main venue
Create first guest list
Set budget categories
Shortlist photographer
Shortlist decor vendor
Shortlist caterer
Shortlist makeup artist
Shortlist entertainment options
Create first payment tracker

8 months before

Finalize venue contract details manually in Zariya
Confirm photographer
Confirm decor direction
Confirm catering direction
Decide rough event sequence
Begin outfit planning
Begin invitation planning
Create first event timeline
Add confirmed vendors to Zariya
Review budget health

6 months before

Confirm decor proposal
Confirm mehendi artist
Confirm entertainment/DJ
Draft invitation list
Send save-the-dates
Confirm catering tasting date
Start outfit fittings
Assign due dates to major tasks
Review vendor payment schedule
Update budget estimates

4 months before

Finalize event themes
Confirm menu for each event

- Finalize invitation design
- Confirm vendor deliverables
- Review pending vendor confirmations
- Confirm ceremony requirements
- Plan guest welcome details at a basic level
- Update payment due dates
- Review pending tasks
- Check budget warnings

2 months before

- Send formal invitations
- Track RSVPs
- Finalize event floor plans
- Finalize decor details
- Finalize sangeet performance order
- Finalize makeup schedule
- Confirm photography schedule
- Confirm catering guest estimates
- Review pending payments
- Prepare final event checklists

1 month before

- Close RSVP follow-ups
- Finalize guest count
- Confirm vendor arrival times
- Confirm event-wise run-of-show
- Confirm VIP seating notes if needed
- Confirm ceremony items
- Confirm outfits and accessories
- Confirm final menus
- Review all unpaid payments
- Review all event checklists

Wedding week

- Confirm all event timings
- Confirm all vendor timings
- Confirm guest count for each event
- Confirm payment status
- Share final schedule manually if needed
- Review event checklists
- Review dashboard alerts
- Mark completed items

Confirm no critical task is pending
Finalize wedding-day plan

Task behavior

Each task row should include:

Checkbox
Task title
Short note
Due date
Category
Assignee, if used in MVP
Status

Statuses:

To do
In progress
Done
Overdue

The user should be able to click a task title and edit the text directly.

The user should also be able to delete a task if it is not applicable.

There should be an option to add a custom task.

8. Full timeline calendar

The Full Timeline calendar shows planning tasks by date.

It answers:

“What is due on each day?”

The page should include:

Month view
Week view
Filters
Upcoming deadlines
Legend
Overall progress

Each calendar item represents a planning task or deadline.

Clicking an item opens the task details.

If several tasks are on one date, the calendar should show a “+ more” option that opens the full list for that day.

9. Events page

The Events page shows all wedding celebrations selected during onboarding or added later.

It answers:

“Which events are part of the wedding, and how ready is each event?”

Important onboarding behavior

If an event is selected during onboarding, Zariya should automatically create an empty card for that event.

For example, if the user selects Haldi, Mehendi, Sangeet, Wedding, and Reception during onboarding, the Events page should already show five event cards.

These cards can start with basic default information and empty fields. The user can then edit each card to add:

Date

Time

Location

Budget, if event-based budgeting is enabled

Checklist progress

Vendors involved

Guest count

Event run-of-show

If an event was not selected during onboarding, it should not appear.

The user can add it later using the “Add new event” button.

Event card information

Each event card should show:

Event name
Date
Time
Location
Progress
Budget, if applicable
Number of pending tasks

Example:

Mehendi
14 Nov 2025
04:00 PM–07:00 PM
Lotus Garden
64% ready
5 pending tasks

Clicking an event card opens that event's detail page.

Event filters

The Events page should include filters:

All events
Upcoming
Ceremonies
Celebrations
Completed

Add new event

The “Add new event” button opens the Add/Edit Event page.

The user can add events such as:

Welcome dinner
Cocktail
After party
Pool party
Baraat
Brunch
Custom event

After saving, the event appears across Events, Dashboard itinerary, and Master Schedule.

10. Event detail page

The Event Detail page focuses on one specific event.

It answers:

“What is planned for this event, what still needs to be done, who is invited, which vendors are involved, and what is the event schedule?”

Event detail sections

The page includes:

Event overview

Checklist

Timeline / run-of-show

Guest count

Vendors involved

Notes

Budget summary, if applicable

Event overview

Shows:

Date

Time

Location

Progress percentage

Short event description

The progress percentage comes from the event checklist.

Event checklist

Each event has a default checklist.

The checklist controls the event progress bar.

The user should be able to:

Mark checklist items complete

Click directly on checklist text to edit it

Delete a checklist item using a simple minus button

Add a new checklist item manually

Change item status to To do, In progress, or Done

This is important because the checklist is pre-made, but every wedding is slightly different. The user should be able to quickly adjust wording or remove items that do not apply.

Event run-of-show

The run-of-show shows the event schedule.

Example for Mehendi:

04:00 PM — Guest arrival & welcome drinks

04:30 PM — Bridal mehendi begins

05:00 PM — Family mehendi stations open

05:30 PM — Chaat & mocktail service

06:15 PM — Games, music & candid moments

06:45 PM — Group photos

07:00 PM — Event wrap

These schedule items should also appear in the Master Wedding Timeline.

Guest count

The event guest count should be calculated automatically from the Guests page.

For example, if 120 guests are invited to Mehendi and 96 have accepted, the Mehendi page should show:

120 invited

96 expected

The user should not manually enter these numbers on the Event Detail page.

Vendors involved

Vendors linked to this event should appear here.

For example:

Mehendi Artist Collective

Lotus Garden

Design Affairs

Flavors of India

Bridal Glow Studio

Shutter Story

These vendors come from the Vendors page or from the vendor selection inside Add/Edit Event.

Notes

The notes section is for simple manual text notes related to the event.

Example:

Use mogra and marigold accents around the main lounge.

Keep fans near the artist seating area.

Reserve one quiet corner for bridal photos.

11. Default event checklists

Each selected event should start with a practical default checklist. These are pre-made but editable.

Haldi checklist

- Confirm Haldi date and time
- Confirm Haldi location
- Confirm guest list for Haldi
- Finalize Haldi decor setup
- Confirm seating arrangement
- Confirm turmeric/ubtan materials
- Confirm outfits for Haldi
- Confirm photographer timing
- Confirm snacks and beverages
- Confirm music or dhol setup
- Confirm cleanup plan
- Confirm transition to next event

Mehendi checklist

- Confirm mehendi date and time
- Confirm mehendi location
- Confirm bridal mehendi artist
- Confirm guest mehendi artist count
- Confirm guest mehendi stations
- Approve bridal seating setup
- Finalize floral lounge decor
- Confirm snacks and mocktails

- Confirm lighting for photos
- Confirm photographer timing
- Prepare stain-removal/touch-up kit
- Confirm event wrap-up plan

Sangeet checklist

- Confirm Sangeet date and time
- Confirm Sangeet venue
- Confirm stage layout
- Confirm sound and lighting
- Confirm DJ or entertainment
- Finalize performance list
- Finalize performance order
- Confirm rehearsal plan
- Confirm couple entry cue
- Confirm family entry cues
- Confirm dinner timing
- Confirm after-party or dance floor timing

Wedding checklist

- Confirm wedding date and time
- Confirm ceremony location
- Confirm priest/pandit timing
- Confirm muhurat
- Confirm mandap setup
- Confirm varmala setup
- Confirm baraat timing
- Confirm bridal entry timing
- Confirm ceremony items
- Confirm family seating
- Confirm photography shot list
- Confirm post-ceremony transition

Reception checklist

- Confirm reception date and time
- Confirm reception venue
- Confirm guest list for reception
- Confirm stage and couple seating
- Confirm decor setup
- Confirm lighting and sound
- Confirm welcome/check-in setup

- Confirm couple entry timing
- Confirm speeches or toast plan
- Confirm dinner service timing
- Confirm photography area
- Confirm final send-off plan

Custom event checklist

- Confirm event date and time
- Confirm event location
- Confirm guest list
- Confirm vendors involved
- Confirm setup requirements
- Confirm food and beverage plan
- Confirm music or entertainment
- Confirm photography timing
- Confirm run-of-show
- Confirm event notes
- Confirm budget, if applicable
- Confirm wrap-up plan

12. Add/Edit Event page

The Add/Edit Event page lets the user create or update an event.

It includes:

- Event details
- Vendor selection
- Timeline builder
- Cancel button
- Save event button

Event details

Fields:

- Event name
- Date
- Start time
- End time

Location

Short description

The user should be able to create events of any duration.

The app should allow:

Events shorter than one hour

Custom start and end times

Overlapping events

Multiple events on the same day

Vendor selection

The page should list vendors already entered in the Vendors page.

Each vendor has a checkbox.

Checking a vendor links that vendor to the event.

This does not create a duplicate vendor. It only connects the existing vendor to the event.

Timeline builder

The timeline builder lets the user create sub-events inside an event.

Examples:

Guest arrival

Bridal entry

Dinner

Performances

Photos

Event wrap

The user should be able to create a sub-event for any duration, including less than one hour.

Examples:

04:00 PM–04:15 PM

04:15 PM–04:45 PM

05:10 PM–05:30 PM

Overlapping sub-events should be allowed because real weddings often have parallel activities.

The app may show a gentle warning if times overlap, but it should not block the user from saving.

Save event

Saving an event updates:

- Events page
- Event detail page
- Dashboard itinerary
- Master wedding timeline
- Linked vendor event lists
- Event guest count, if guests are assigned to that event

13. Master Wedding Timeline

The Master Wedding Timeline is the actual wedding schedule, not the planning task timeline.

It answers:

“What is happening during the wedding days, at what time, and where?”

Timeline views

The page should include:

- Calendar view
- List view
- Print layout, if supported as a simple browser print view

Calendar view

Calendar view shows wedding dates as columns and time blocks inside each date.

Each block represents a main event or sub-event.

Examples:

- Haldi Ceremony
- Bridal Mehendi
- Sangeet Sound Check
- Wedding Ceremony
- Dinner Service
- Reception Welcome
- Dance Floor & DJ

List view

List view shows the same information in chronological order.

Example:

14 Nov 2025
10:00 AM–12:00 PM — Haldi
04:00 PM–07:00 PM — Mehendi
08:00 PM–11:00 PM — Sangeet

Overlaps

The Master Timeline should allow overlapping items.

Overlaps should display side by side, similar to a calendar app.

This is important because wedding activities often happen at the same time.

14. Guests page

The Guests page manages the guest list and RSVP status.

It answers:

“Who is invited, who accepted, who is pending, who declined, and which events are they invited to?”

Guest summary cards

The top cards show:

Total guests
Accepted
Pending RSVP
Declined

These numbers are calculated from guest records.

Guest table

Each guest row should include:

Guest name
Phone or email
Side or segment
RSVP status
Invited events
Notes

Example:

Sunita Mehra
Bride side
Accepted
Haldi, Wedding, Reception
Vegetarian, VIP seating

Guest filters

Filters can include:

All guests
Accepted
Pending
Declined
Bride side
Groom side
Family
Friends

The user should also be able to filter by event.

Add guest

The Add Guest form should include:

Name
Phone
Email
Side or segment
RSVP status
Invited events
Notes

The invited events field is important because it controls event guest counts.

For example, if a guest is invited to Mehendi and their RSVP is Accepted, that guest should automatically be counted in the Mehendi expected guest count.

Automatic guest calculations

The guest data should automatically update:

- Dashboard guest summary
- Guests page totals
- Event guest counts
- RSVP overview
- Guest segment counts

The user should not manually enter guest totals on any other page.

15. Vendors page

The Vendors page stores all vendor information manually.

It answers:

“Who are the vendors, what category are they in, what is their status, and what payments are connected to them?”

Vendor summary cards

The page shows:

- Total vendors
- Contracts confirmed
- Pending / review
- Payment follow-ups

These are calculated from vendor records.

Vendor directory

Each vendor row includes:

- Vendor name
- Category
- Contact person
- Phone/email

Contract status
Payment status
Notes

Example:

The Grand Udaipur
Venue
Ritesh Mehta
Confirmed
Deposit paid
Ballroom and stay block secured

Vendor filters

Filters include:

All vendors
Confirmed
Pending
In review
Payment due
Category dropdown

Vendor actions

Each vendor row should allow:

View vendor
Edit vendor
Add payment
Link to event
Change contract status
Change payment status
Delete vendor

16. Add/Edit Vendor page

The Add/Edit Vendor page creates or updates a vendor profile.

Vendor fields

The form includes:

Vendor name
Category
Business or brand name
Service city
Contact person
Phone number
Email address
Alternate contact
Preferred communication method
Contract status
Payment status
Total agreed amount
Advance amount
Next payment due date
Notes
Preferred events served

All information is entered manually.

There should be no file upload field in the MVP.

Vendor category options

Default categories:

Venue
Decor
Catering
Photography
Makeup
Mehendi artist
Entertainment
Choreographer
Priest
Transport
Hospitality
Other

Contract status options

Not contacted
Shortlisted
In review
Pending

Confirmed
Cancelled

Payment status options

Unpaid
Advance due
Deposit paid
Partial paid
Paid
Overdue

Preferred events served

The user can select which events the vendor is connected to.

Example:

Wedding
Reception
Mehendi
Sangeet
Haldi

If the vendor is linked to Mehendi, the vendor should automatically appear in the Mehendi event detail page.

Save vendor

Saving a vendor updates:

Vendors page
Vendor count cards
Event vendor sections
Budget page, if amount is entered
Payments page, if due date or payment amount is entered
Dashboard alerts, if action is needed

17. Budget page

The Budget page shows the overall financial health of the wedding.

It answers:

“How much was planned, how much is actually committed, how much has been paid, and what is over budget?”

Budget summary

The top cards show:

Total budget
Amount spent
Amount committed
Remaining amount

Definitions:

Total budget = the overall planned wedding budget
Amount spent = payments marked as paid
Amount committed = confirmed unpaid vendor amounts
Remaining amount = total budget minus spent and committed

Overall budget health

The chart shows:

Spent
Committed
Remaining

This is calculated automatically.

Category-wise budget

Budget categories show planned amounts by category.

Example:

Venue
Catering
Decor
Photography
Entertainment
Hospitality
Transport
Outfits
Invitations

Gifts
Miscellaneous

Each category should compare:

Estimated budget
Actual amount
Paid amount
Pending amount

Estimated vs actual

This section shows where actual costs are higher or lower than planned.

If actual is greater than estimated, the category should show an over-budget warning.

Overspending alerts

The app should highlight categories where spending is over budget.

Example:

Decor is ₹1,75,000 over budget
Hospitality is ₹1,20,000 over budget

Clicking the alert should open the relevant category.

18. Budget categories page

The Budget Categories page gives detailed information for each category.

Each category card shows:

Category name
Primary vendor, if any
Estimated amount
Actual amount
Paid amount
Pending amount
Budget health

When expanded, the category can show:

Vendor details
Payment schedule
Manual notes
Spending breakdown, if entered

Over-budget action

If a category is over budget, the three-dot menu should include:

Edit estimated budget
Update budget to actual
Add payment
Add note
View linked vendors

The important action is:

Update budget to actual

This means the user accepts the current actual price as the new budget.

Example:

Decor estimated budget: ₹17,50,000
Decor actual: ₹19,25,000
Over budget by ₹1,75,000

If the user clicks “Update budget to actual,” the estimated budget becomes ₹19,25,000 and the warning is removed.

The payment records should not change. Only the planned budget changes.

The app should ask for confirmation before applying this.

19. Payments page

The Payments page tracks what is due and what has been paid.

It answers:

“What payments are coming up, what is still pending, and what has already been paid?”

Upcoming payments

The upcoming payments table shows:

Vendor
Purpose
Amount
Due date
Priority

Priority can be based on due date.

Example:

Due in 7 days or less = High
Due in 8–15 days = Medium
Due later = Low

Pending balances

Pending balances show unpaid amounts grouped by payment type.

Example:

Deposits pending
Installment balances
Final settlements

Vendor-wise dues

This table shows:

Vendor
Category
Total committed
Paid
Balance due
Next due date

Balance due is calculated as:

Total committed - paid amount

Paid payments

The paid payments table shows:

Paid date
Vendor
Amount
Method

Payment methods can include:

Bank transfer
UPI
Card
Cash
Other

Add or update payment

A payment can be entered from the Payments page or from a vendor record.

Payment fields include:

Vendor
Category
Purpose
Amount
Due date
Paid date, if paid
Payment method
Status
Notes

Updating a payment automatically updates:

Payments page
Vendor payment status
Budget page
Dashboard payment summary
Budget category paid and pending amounts

20. Data connection rules

Zariya should behave as one connected system.

Guest connection

Guest information is entered once in Guests.

It then updates:

- Dashboard guest summary
- Guests page totals
- Event guest counts
- RSVP overview
- Guest segments

Vendor connection

Vendor information is entered once in Vendors.

It then updates:

- Vendor directory
- Event vendor sections
- Budget categories
- Payments page
- Dashboard alerts

Payment connection

Payment information is entered once.

It then updates:

- Payments page
- Vendor payment status
- Budget spent amount
- Budget pending amount
- Budget category health
- Dashboard summary

Event connection

Event information is created from onboarding or Add New Event.

It then updates:

- Events page
- Event detail page
- Dashboard itinerary
- Master wedding timeline

Guest invited-event options
Vendor preferred-event options

Budget connection

Budget information updates automatically from:

Category estimates
Vendor amounts
Payment records

The user should not manually update dashboard budget numbers.

21. Settings page

The Settings page should allow basic workspace setup.

Settings should include:

Wedding name
Couple names
Wedding location
Wedding dates
Selected events
Budget categories
Total budget
Notification preferences
Restart dashboard guide

The user should be able to add, remove, or rename events from settings.

If an event is removed, the app should ask for confirmation because it may affect event checklists, schedules, and guest invited-event selections.

22. Visual style

Zariya should feel calm, premium, elegant, and culturally suited to Indian destination weddings.

The visual design should use:

Warm ivory backgrounds
Gold accents
Soft pastel status colors
Rounded cards
Decorative Indian motifs
Elegant serif headings
Clean tables
Spacious layouts
Subtle shadows
Simple line icons

The design should feel organized and luxurious, not corporate or cluttered.

23. Final functional summary

Zariya is a connected planning workspace for Indian destination weddings.

The Dashboard shows what needs attention.

The Timeline shows what planning tasks need to be done.

The Events page shows all selected wedding celebrations.

The Event Detail page manages one event's checklist, schedule, vendors, guests, and notes.

The Guests page manages RSVP and invited-event information.

The Vendors page stores vendor contact, contract, payment, and event-link information.

The Budget page tracks estimated versus actual spending.

The Payments page tracks due, pending, and paid vendor payments.

The Master Wedding Timeline shows the actual wedding-day schedule.

The most important product rule is:

Enter once, update everywhere.

This is what makes Zariya useful. The couple should not have to manually connect information across different pages. Zariya should automatically reuse the same guest, vendor, event, payment, and budget information wherever it is needed.

The final feeling for the user should be:

"I know what is happening with my wedding, what still needs to be done, and what needs my attention next."
